About our flu activity reporting

MSDH relies upon selected sentinel health practitioners across the state to report the percentage of non-trauma visits consistent with an influenza-like illness (ILI: fever of 100°F or higher AND cough and/or sore throat). Also, providers are supplied with specimen collection kits. Samples are submitted to the Mississippi Public Health Laboratory for influenza PCR testing. Reports are used to estimate the state's ILI rate and the magnitude of the state's influenza activity. Reports represent only the distribution of flu in the state, not an actual count of all flu cases statewide. *Information is provisional only and may change depending on additional reporting from sentinel providers.*

State ILI Surveillance

<table>
<thead>
<tr>
<th>Statewide ILI Data, Week 19 ending May 11, 2013</th>
<th>Current Season compared to Previous Season</th>
</tr>
</thead>
</table>

For week 19 (05/05/2013-05/11/2013), the overall state ILI rate (2.9%) was **comparable** to last week (2.6%) and was slightly **lower** when compared to this time last year (3.6%). | Figure 1 |

Total number of non-trauma patients treated by sentinel providers in the last three weeks. | Table 1 |

During week 19, three districts (1, 2, and 6) had an increase in ILI activity, while three districts (3, 4, and 5) had a decrease. Three districts (7, 8, and 9) remained about the same. Information is provisional only and may change depending on additional reporting from sentinel providers. | Table 2

Since week 35, the percentage of reported ILI cases has been highest among those in the 5 to 24 years of age group, followed by those in the 0 to 4 years of age group. During week 19, the percentage of reported ILI cases was highest among individuals in the 0 to 4 years of age group. | Figure 2
The 2012-13 state ILI rate was **slightly above** the national and Region 4 baselines, but was **below** the state baseline for week 19. | **Figure 3**

*Region 4 consists of AL, FL, GA, KY, MS, NC, SC, and TN.*

Flu Testing Reports

From week 35 (week ending September 1st) through week 19 (week ending May 11th), 165 positive influenza samples were identified by MSDH. 125 were influenza A and 40 were influenza B. 116 were subtyped as influenza A (H3) and six were subtyped as influenza A (H1). Three samples did not have subtyping performed. The last positive influenza sample identified by MSDH occurred in week 14 (week ending April 6th). | Figure 5

The influenza cases were identified from the following counties: Amite (2), Attala (3), Benton, Calhoun, Carroll, Chickasaw (4), Clarke (2), Clay, Copiah (2), Covington (4), DeSoto (4), Grenada, Harrison (12), Hinds (12), Itawamba (2), Jefferson Davis (5), Kemper (2), Lamar (5), Lauderdale, Lawrence, Lee (6), Leflore (3), Madison (2), Marion (4), Marshall (28), Monroe (6), Neshoba (2), Oktibbeha (7), Pearl River, Pontotoc (3), Rankin (5), Sharkey, Tate (7), Tippah (3), Tishomingo (5), Union (3), Walthall (2), Warren, Washington (7), and Yazoo (3).
National Pediatric Mortality Surveillance

Nationally, there was one influenza-associated pediatric death reported to CDC during week 19. This death was associated with an influenza A virus for which the subtype was not determined and occurred during week 51 (week ending December 22nd). | Figure 6

The total number of influenza-associated pediatric deaths reported during the 2012-2013 season to date is 139. Of the 139 deaths, 74 (53%) have been attributed influenza B viruses, 32 (23%) to influenza A viruses for which the subtype was not determined, 28 (20%) to influenza A (H3) viruses, 4 (3%) to influenza A (H1) viruses, and 1 (0.7%) to an influenza A and B virus. | Figure 7

Mississippi has had one influenza-associated pediatric death reported during this influenza season. Additional data can be found at: http://gis.cdc.gov/GRASP/Fluview/PedFluDeath.html.
National ILI Surveillance

For week 19, the MS ILI rate continued to remain above the national rate. ▶ Figure 8

Mississippi reported "No Activity" flu activity for week 19. ▶ Table 4

<table>
<thead>
<tr>
<th>Level of Flu Activity</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>No Activity</strong></td>
<td>Overall clinical activity remains low and there are no lab confirmed cases.</td>
</tr>
<tr>
<td><strong>Sporadic</strong></td>
<td>Isolated cases of lab confirmed influenza in the state; ILI activity is not increased OR A lab-confirmed outbreak in a single institution in the state; ILI activity is not increased.</td>
</tr>
<tr>
<td><strong>Local</strong></td>
<td>Increased ILI within a single region AND recent (within the past 3 weeks) laboratory evidence of influenza in that region. ILI activity in other regions is not increased OR two of more institutional outbreaks (ILI or lab confirmed) within a single region AND recent (within the past 3 weeks) lab confirmed influenza in that region. Other regions do not have increased ILI and virus activity is no greater than sporadic in those regions</td>
</tr>
<tr>
<td><strong>Regional</strong></td>
<td>Increased ILI in at least 2 regions but fewer than half of the regions AND recent (within the past 3 weeks) lab confirmed influenza in the affected regions OR Institutional outbreaks (ILI or lab confirmed) in at least 2 regions but fewer than half of the regions AND recent lab confirmed influenza in the affected regions.</td>
</tr>
<tr>
<td><strong>Widespread</strong></td>
<td>Increased ILI and/or institutional outbreaks (ILI or lab confirmed) in at least half of the regions AND recent (within the past 3 weeks) lab confirmed influenza in the state.</td>
</tr>
</tbody>
</table>
During week 19, influenza activity remained low in the United States.¹ | Figure 9
