Technical Notes: Population-based rates were calculated using 2000 census data for Mississippi produced by the U.S. Bureau of the Census. Versions of this publication prior to 1997 were based on the 1990 census population data. For this reason, the population-based rates presented here and in 1997 are not directly comparable to those from previous years. Because the population estimates show Mississippi's population to be increasing, many of the rates will have decreased dramatically from those published prior to 1997. However, due to the changing age structure of the population, some rates (especially for younger age groups) may increase because of the change in population figures.

Beginning in 1999, cause of death coding utilizes the <u>International Statistical Classification of Diseases and Related</u> <u>Health Problems, Tenth Revision</u> (ICD-10). Every effort has been made to make the figures in this publication comparable to previous versions. However, caution should be used when comparing between the ICD-9 and ICD-10 revisions.
